

SONOGRAPHIC LIVER PATTERNS

www.nurseinfo.in

- Normal
- Centrilobular
- Fatty-fibrotic

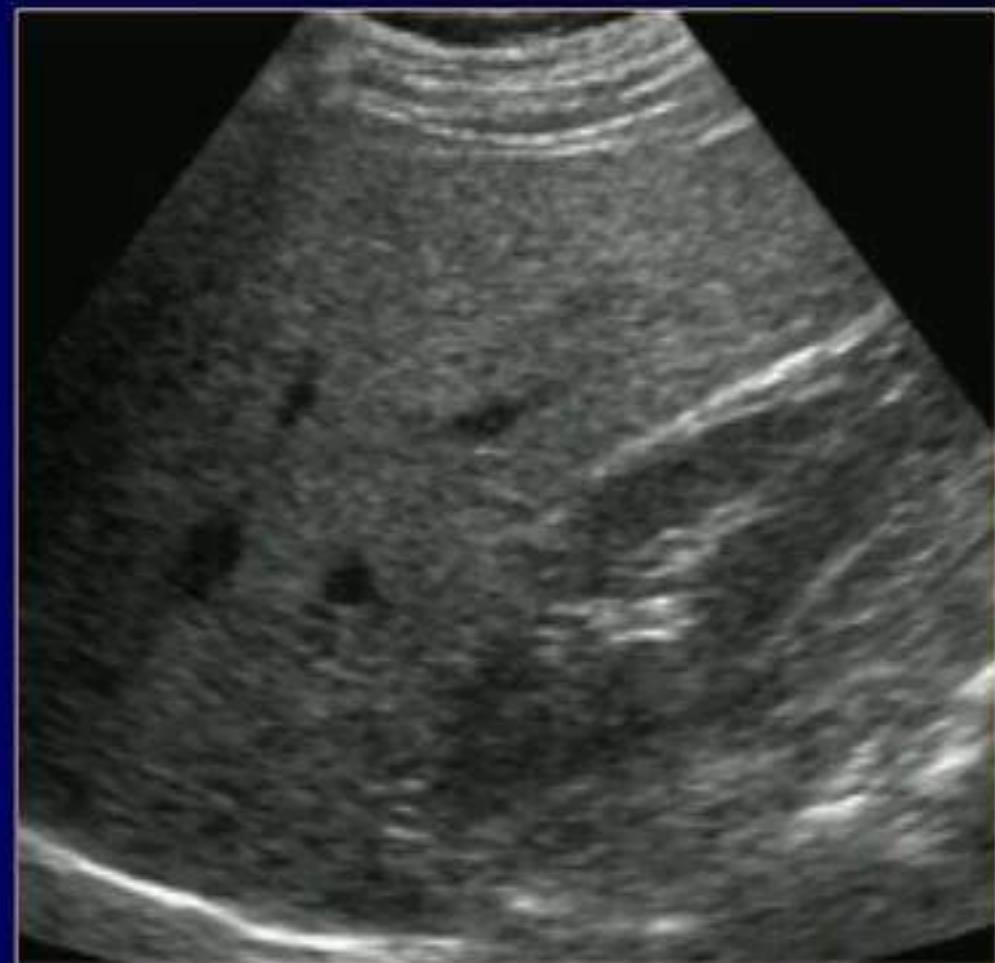

CENTRI-LOBULAR PATTERN

- Decreased echogenicity of liver parenchyma
- Increased visualization of PV walls
 - increased brightness
 - increased number
- Acute hepatitis, acute RT heart failure, leukemia/lymphoma, toxic shock, 2% normals

FATTY-FIBROTIC PATTERN

- Increased echogenicity of liver parenchyma
- Decreased definition of PV walls
- Echotexture
 - homogeneous (fine)
 - heterogeneous (coarse)
- Posterior sound attenuation
- Fatty infiltration, chronic hepatitis, cirrhosis, acute alcoholic hepatitis

FATTY - FIBROTIC PATTERN

Echotexture

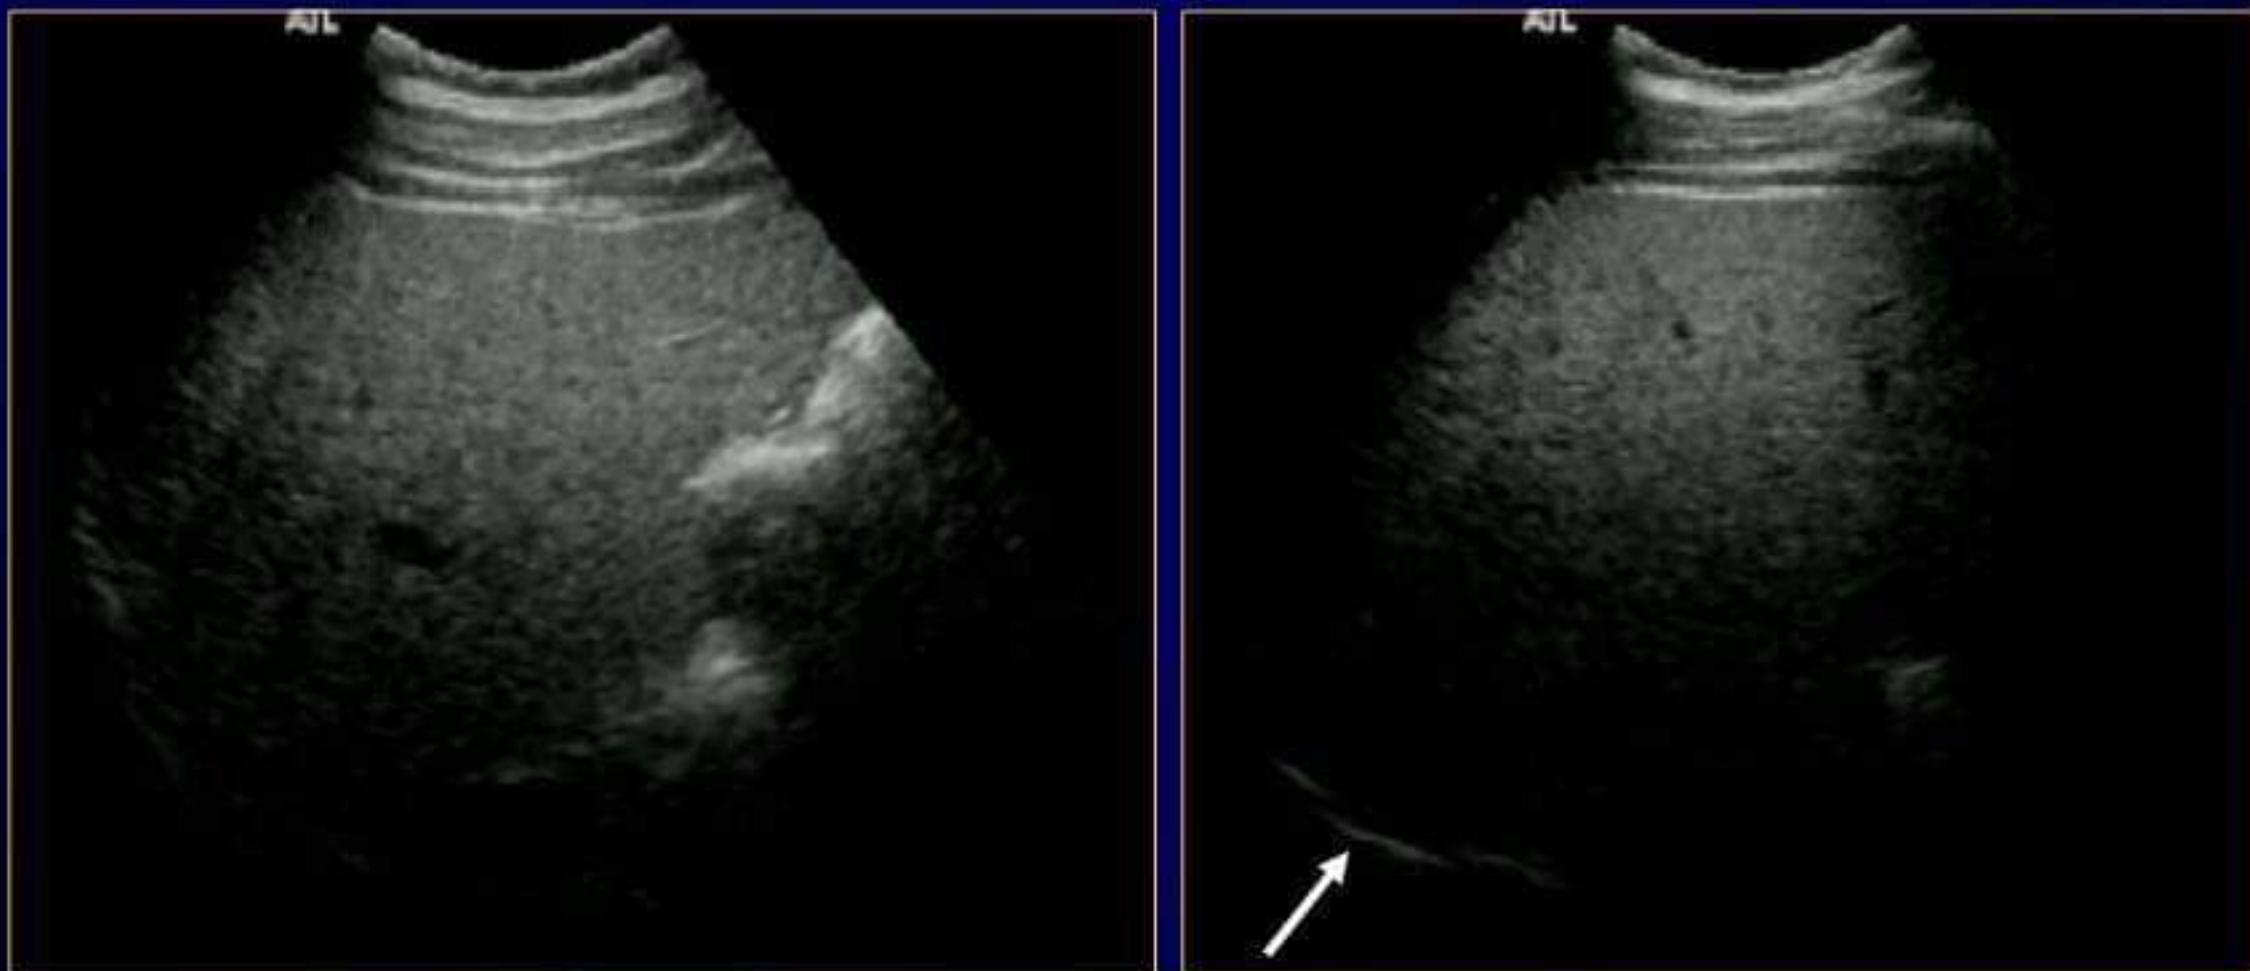

Homogeneous

Heterogeneous

FATTY LIVER

- Posterior sound attenuation
- Enlarged liver
- Tends to have fine homogeneous echotexture

FOCAL FATTY LIVER CHANGES

- Focal fatty infiltration

- Focal fatty sparing

LIVER CIRRHOSIS

- Fatty-fibrotic pattern
 - heterogeneous echotexture (coarse “motheaten”)
 - almost no posterior attenuation
- Shrunken liver
- Nodular surface
- Elevated caudate:right lobe ratio (>0.73 has 99% specificity for cirrhosis)

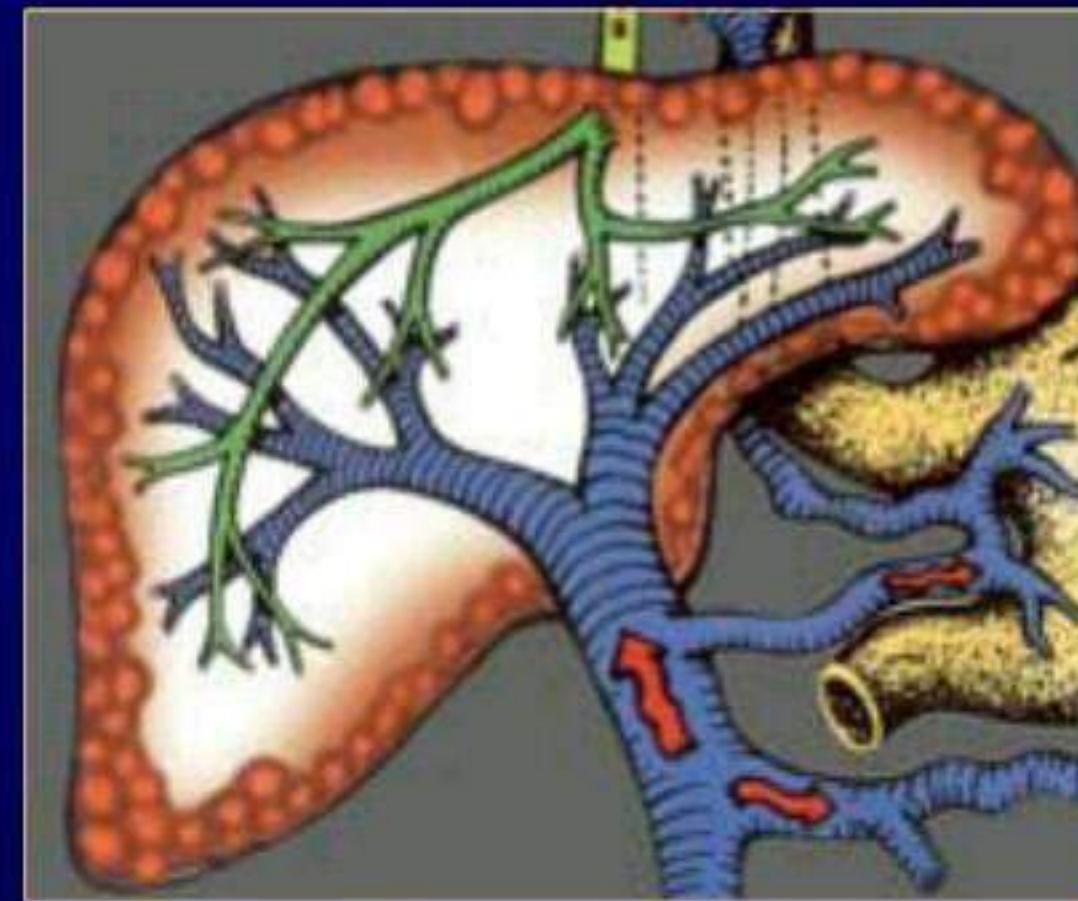

LIVER CIRRHOSIS

- Accounts for > 90% of all portal hypertension
- Distorted liver architecture
 - Fibrosis
 - Regenerating nodules
 - Distorted vascular channels

PORTAL HYPERTENSION

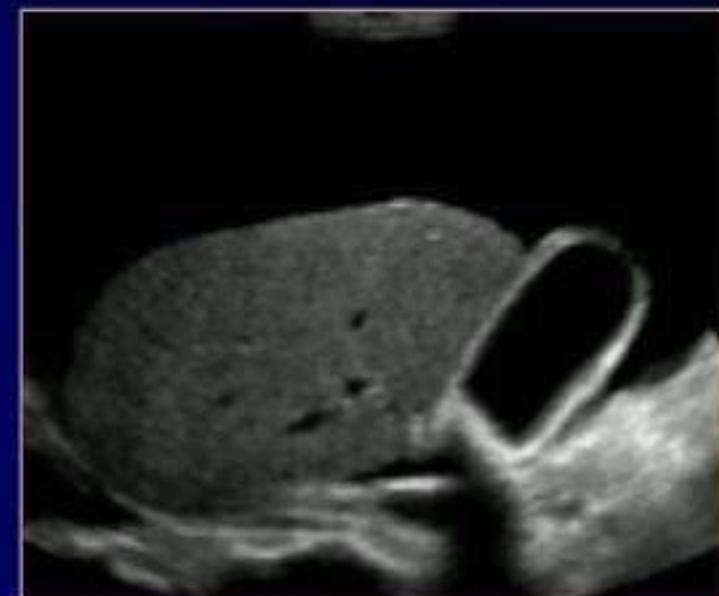

↑ hepatic resistance, ↑ portal venous pressure,
eventually ↓ portal flow, reversed portal flow
Prognostication for risk of hemorrhage

PORTAL HYPERTENSION

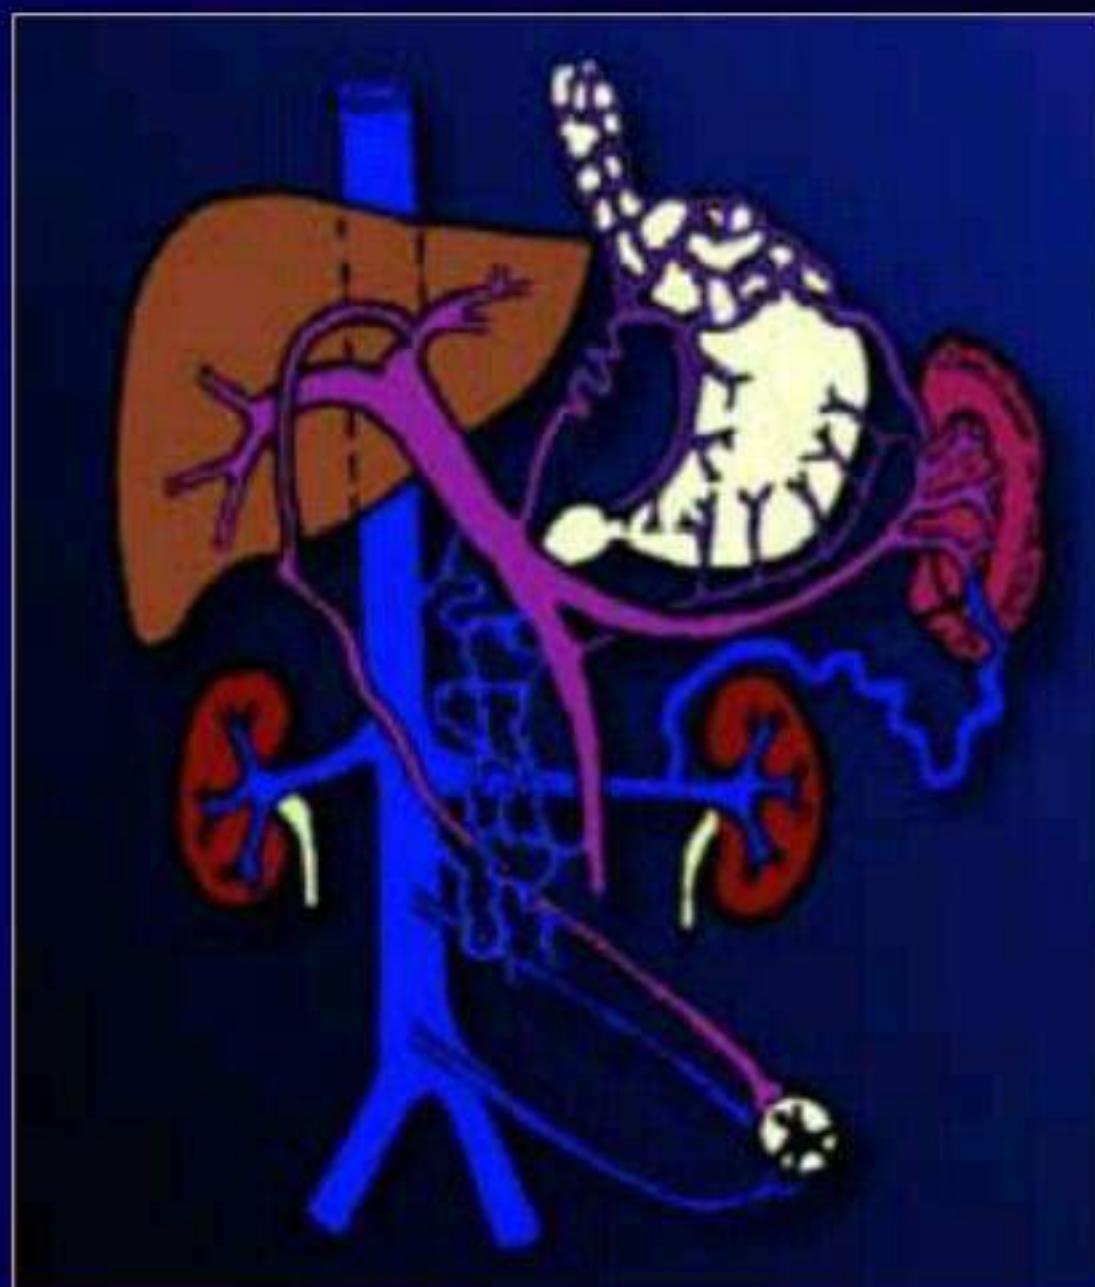

Sonographic Signs

- Ascites
- Dilated MPV, SV, SMV
- Collaterals
- Splenomegaly
- Various Doppler findings

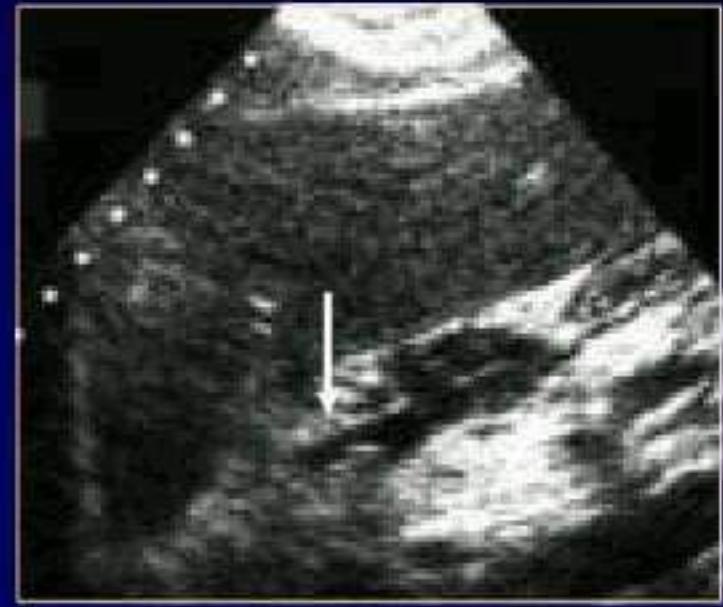

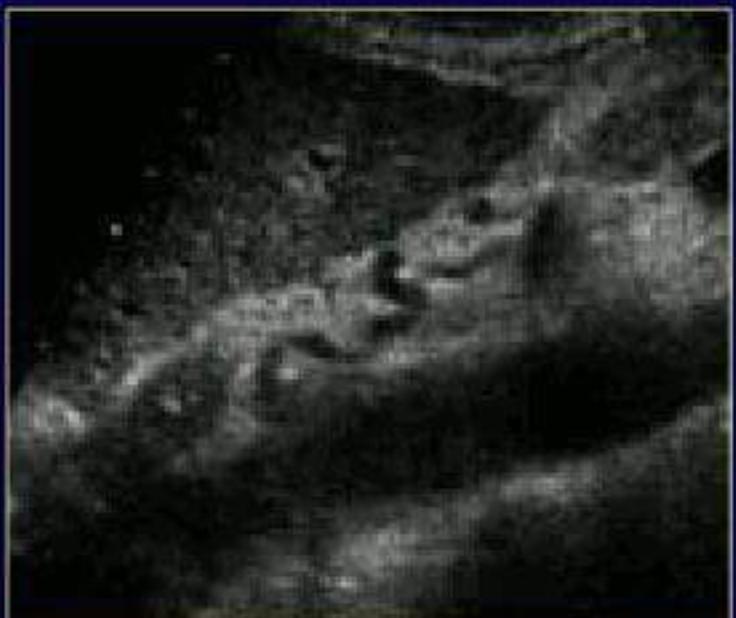

COLLATERAL VEINS

- Gastroesophageal
- Coronary
- Umbilical
- Gastosplenic
- Splenorenal/gastrorenal
- Perisplenic
- Intestinal
- Retroperitoneal

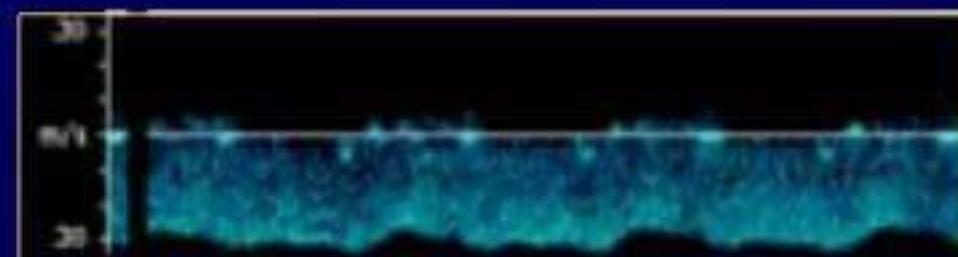

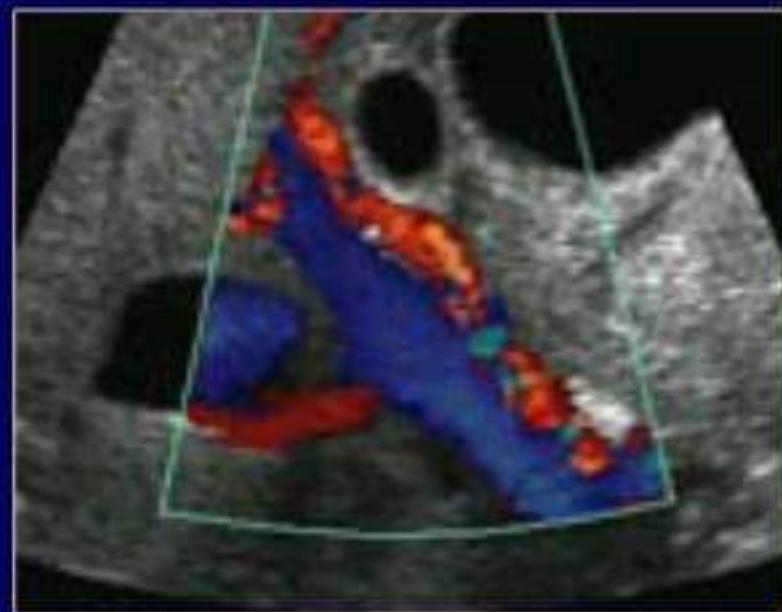

PORTAL HYPERTENSION

Collateral Vessels

DOPPLER in PORTAL HYPERTENSION

- Portal veins:
 - loss of respiratory variation
 - decreased velocity MPV
 - hepatofugal (reversed) flow
- Hepatic veins:
 - loss of normal pulsatility
 - non-triphasic flow
 - flattened waveform
- Hepatic arteries:
 - enlarged hepatic arteries

PORTAL HYPERTENSION

Enlarged Hepatic Arteries

A cause of intraparenchymal “double duct” sign

FOCAL LIVER MASSES

- US is excellent in detecting focal liver lesions
- US is specific for liver cysts > 1 cm
- Not good in differentiating among pathologic entities
 - Very few US features are characteristic
- Not good in distinguishing between benign and malignant masses
- Triple phase Liver CT and MRI are excellent
- US is very helpful for diagnosis in the proper clinical setting, for follow-up and as guidance for biopsy

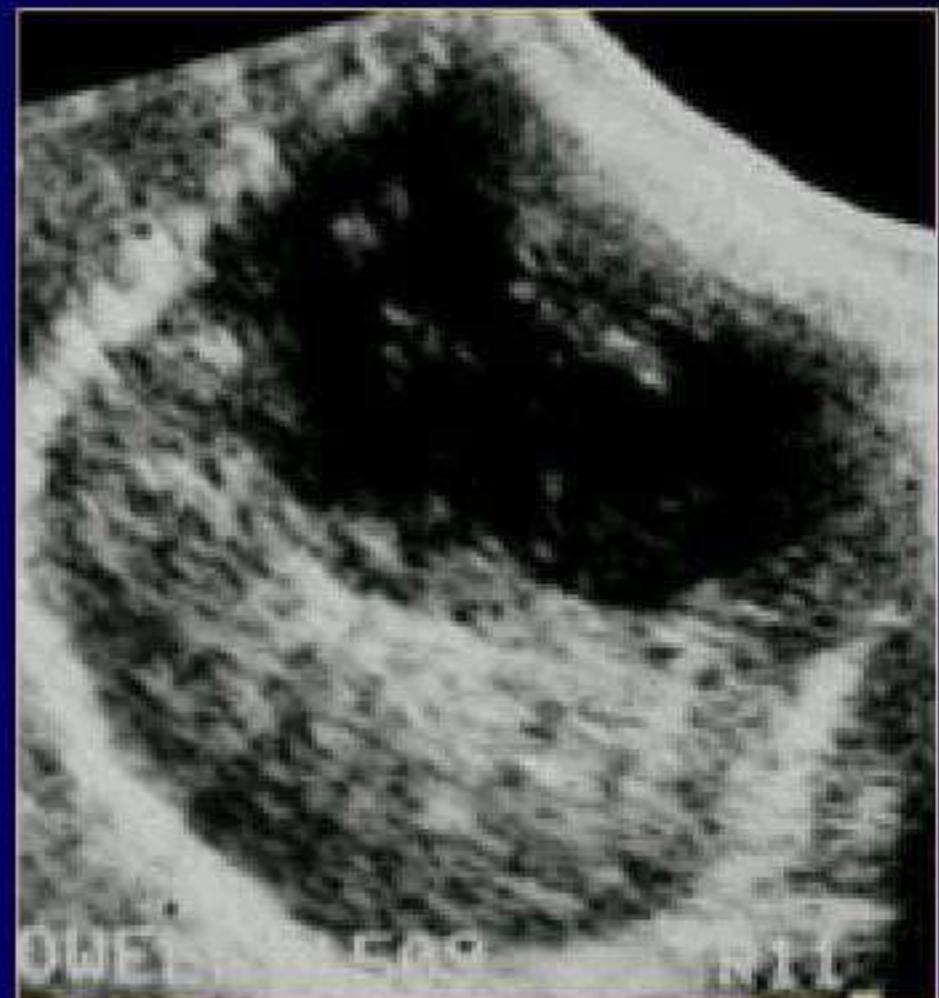

SIMPLE CYSTIC LESIONS

- Cyst
- Old hematoma
- Abscess (hydatid)
- Biloma / seroma
- Vascular
 - aneurysm
 - fistula (a-pv, p-hv)

COMPLEX CYSTIC LESIONS

- Hemorrhagic cyst
- Infected cyst
- Hematoma
- Abscess
- Biloma / seroma
- Biliary cystadenoma
- Cystic/necrotic malignant tumors

LIVER ABSCESS

- May cause difficulty in diagnosis

CHARACTERISTIC LESION

Echinococcal cyst with laminated membrane

COMPLEX CYSTIC LESIONS

Benign versus Malignant

Echinococcal cyst

Metastases

HYPOECHOIC MASS

BENIGN

Abscess

Adenoma

Focal nodular
hypoplasia

Hemangioma

Microabscesses

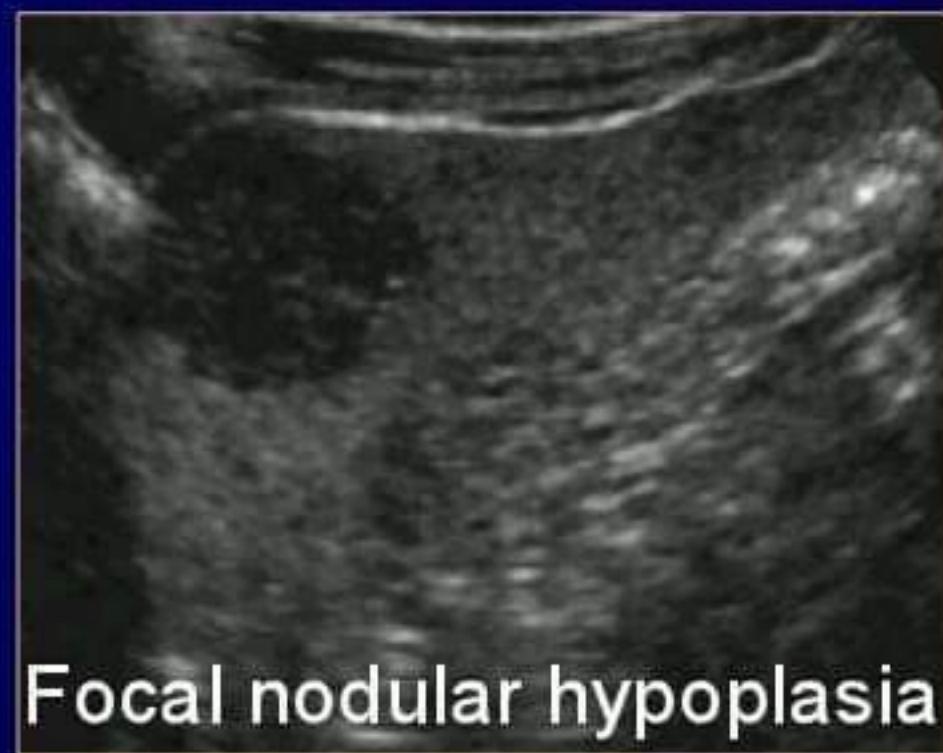

Focal fatty sparing

MALIGNANT

Metastasis

Hepatocellular
carcinoma

Lymphoma

CHARACTERISTIC LESION

- Focal nodular hyperplasia with a central scar
- But not diagnostic

CENTRAL SCAR IN LESION

Hepatocellular carcinoma,
Fibrolamellar type

Giant hemangioma

CHARACTERISTIC LESION

- Hyperechoic hemangioma

ATYPICAL HEMAGIOMAS

HYPERECHOIC MASS

BENIGN

Hemangioma

Abscess

Adenoma

Focal nodular
hypoplasia

Focal fat

Hemorrhagic cyst

MALIGNANT

Metastasis

Hepatocellular
carcinoma

Lymphoma

Thyroid cancer metastasis

MULTIPLE SOLID MASSES

- Metastases

Regenerating nodules
in cirrhosis

Lymphoma

MULTIPLE SOLID MASSES

- Multifocal HCC, Multiple hemangiomas, microabscesses

Multiple hemangiomas

Microabscesses

CHARACTERISTIC METASTASES

- Colon metastases

Also seen with cancers of ovary, breast, stomach, pancreas, osteosarcoma, leiomyosarcoma, chondrosarcoma, teratocarcinoma

US GUIDANCE

- Usefulness of sonography
- For aspiration, biopsy and drainage
